

ABSTRACT OF THE DISCLOSURE

An integral or multi-component linkage structure formed at least partially by extrusion techniques to ensure uniformity and modularity. The structure includes a body section and a head section, which may be integrally or separately formed via extrusion or molding techniques. The body section may be extruded longitudinally or laterally relative to the longitudinal axis of the structure. The head section may be integrally formed with the body section, or it may be separately formed by extrusion or molding techniques for insertion into a receptacle of the body section.
